(54) CONNECTOR FOR CARD

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a connector for card of a structure which can completely lock the inserted card, without causing increase in parts numbers, and enlargement of the connector.

SOLUTION: The connector is equipped with an insulated housing 1, with which terminals 6 are arranged in lining up side-by-side, and a shell cover 2 attached to the insulated housing 1, by which extraction and insertion of card C are enabled. A heart cam block 23 which moves in a direction of the insertion and extraction according to the insertion and extraction of card C is installed in one side, and a card-discharging mechanism of push/push type is constituted through the heart cam block 23. A projection part 34 for hooking is formed at a portion which is counterposed to the side of the card C of the heart cam block 23. The omission of the card C in an insertion state is prevented, by jointing the projection part 34 with a dent part 45 formed in the side of the card C.
